

H/A - Automatic Failover

Mitigate Risk and Optimize Imaging Network Operations

Silverback® may be deployed in a variety of configurations to ensure the platform operates without failure. High availability is achieved by deploying an additional instance of Silverback® next to the principal server software which shares the same database and cache. If the principal server fails, the secondary instance of Silverback initiates service immediately to function without interruption with the shared/synchronized DB and cache.

Silverback® Advantage

- ✓ Mitigate risk of damage to system and software
- ✓ Maximize database and Cache resources in support of business requirements
- ✓ Mitigate risk of system downtime
- ✓ Reduces maintenance, testing cost and downtime with synchronized SW
